

## PlainID: Easy and secure migration to the Cloud

PlainID empowers organizations by dramatically reducing the overall investment in authorization management and control.

PlainID utilizes an innovative approach to simplify and optimize dynamic, fine grained access to resources and data. Moving to the cloud, implementing mobile based solutions and enhancing the on premise authorization control, becomes much easier with PlainID.

## The Challenge

Managing authorizations (who can do what, in the app) has always been a challenge.

This challenge is amplified when the organization decides to use cloud services, such as AWS.

- How can existing users access cloud environments?
- How should (or can) existing authorization policy be enforced?
- How can that be done with minimal IT efforts?
- How can a unified view of internal and externally managed resources be maintained?
- How can we avoid extending the security perimeter of the organization?

## The Solution: An AuthZ solution that works for you

PlainID dramatically reduces the overall investment in authorization by providing an agile, dynamic, standards based, externalized authorization solution.

### Fast and easy implementation

Using PlainID requires no external user repository, no replication, and minimal definitions in the cloud service provider.

PlainID uses internal authorization data, to leverage the migration process to the cloud.

### Contextual & fine-grained decisions

PlainID provides dynamic, realtime access decision based on user attributes, environmental attributes (time, location, etc.) and events.

### A business-oriented approach

Our solution is designed for business owners and administrators to define, understand and use. The business policy can be defined, regardless of its technical implementation. It can be an on-prem solution today, and in the cloud as a service tomorrow.

### In-depth analytics and Insights

PlainID provides visibility with a full audit trail. Compliance, regulation and audit requirements are easily managed on a simple graph-based UI.

### Central management

A central management view presents the user in both worlds, on premise and in the cloud. Providing an ideal option for hybrid environment management.

### Self-service

PlainID provides a self-service portal that enables users to request access to resources and data in the cloud.

## It's all about AuthZ

- AuthZ should be easily given and easily revoked.
- AuthZ should be available *anywhere* needed (In the Organization, In the Cloud, on the Mobile Device, etc.).
- AuthZ should be spoken in a business language, in addition to the technical one.
- AuthZ should be easily viewed and analyzed.
